

Cisco Secure Workload - NIST SP 800-82 Compliance Report

Customer-Facing Compliance Report

Framework: NIST SP 800-82 - Guide to Operational Technology Security

Primary audience: Security architects, plant IT/OT teams, industrial asset owners, and SOC teams.

CSW positioning: OT-adjacent IT segmentation for jump hosts, historians, patch repositories, identity services, and vendor access.

Executive Summary

Cisco Secure Workload (CSW) can support this framework by producing workload-level evidence for inventory, application dependency mapping, segmentation design, policy simulation, vulnerability context, and incident investigation. The strongest customer story is not that CSW "certifies" compliance; it is that CSW turns workload communication into evidence that control owners, assessors, and technical teams can review.

Suggested CSW Scope Pattern

NIST-800-82 > OT-Facing-IT, Industrial-DMZ, Jump-Hosts, Historians, Patch-Repositories, Vendor-Access

This scope pattern should be validated with the customer's architecture, application owners, compliance team, and assessor before it is used for formal evidence.

Outcomes CSW Can Support

- ? Map IT-side workloads that support OT operations.
- ? Constrain jump-host, vendor, historian, and patch-repository paths.
- ? Identify high-risk ports and unexpected IT-to-OT communication.
- ? Separate CSW-covered IT workloads from OT-native visibility requirements.

Evidence Package

- ? OT-adjacent workload inventory
- ? Vendor and remote-access flow summary
- ? Jump-host / historian dependency maps
- ? Cannot-instrument register
- ? Policy candidate and rollback notes

POV / Workshop Approach

1. Select one business service, regulated boundary, or critical workload group.
2. Validate workload coverage and install sensors or configure supported connectors.
3. Apply labels for application, environment, owner, data class, criticality, compliance

scope, and lifecycle.

4. Observe flows over a representative business window.

5. Use ADM to generate a candidate policy and review it with the application owner.

6. Package inventory, scope, flows, policy, exceptions, and known gaps as the evidence output.

Boundaries and Complementary Controls

CSW does not inspect PLC/RTU/IED/HMI fieldbus behavior or replace Cyber Vision, Claroty, Nozomi, Dragos, OT firewalls, or plant change control.

Disclaimer
