

Customer-Facing Compliance Report

Framework: IEC 62443 - Industrial Automation and Control Systems Security

Primary audience: Industrial, manufacturing, energy, utilities, and OT security teams designing zones and conduits.

CSW positioning: Zones and conduits segmentation, IT-side OT boundary hardening, SR control evidence, and complementary OT device visibility.

Executive Summary

Cisco Secure Workload (CSW) can support this framework by producing workload-level evidence for inventory, application dependency mapping, segmentation design, policy simulation, vulnerability context, and incident investigation. The strongest customer story is not that CSW "certifies" compliance; it is that CSW turns workload communication into evidence that control owners, assessors, and technical teams can review.

Suggested CSW Scope Pattern

IEC-62443 > IT-OT-Boundary, Industrial-DMZ, Jump-Hosts, Engineering-Workstations, Historians, Vendor-Access

This scope pattern should be validated with the customer's architecture, application owners, compliance team, and assessor before it is used for formal evidence.

Outcomes CSW Can Support

- ? Map IT-side workloads that participate in OT access paths.
- ? Document conduit-like communication between industrial support systems.
- ? Identify unexpected lateral movement paths near the OT boundary.
- ? Package SR-aligned segmentation and monitoring evidence.

Evidence Package

- ? Zone and conduit workload inventory
- ? IT/OT boundary flow summary
- ? Jump host and vendor-access dependency map
- ? Policy candidate and exception register
- ? Cannot-instrument OT device layer notes

POV / Workshop Approach

1. Select one business service, regulated boundary, or critical workload group.
2. Validate workload coverage and install sensors or configure supported connectors.
3. Apply labels for application, environment, owner, data class, criticality, compliance

scope, and lifecycle.

4. Observe flows over a representative business window.

5. Use ADM to generate a candidate policy and review it with the application owner.

6. Package inventory, scope, flows, policy, exceptions, and known gaps as the evidence output.

Boundaries and Complementary Controls

CSW does not replace OT-native asset discovery or protocol inspection. Pair it with Cisco Cyber Vision, Claroty, Nozomi, Dragos, OT firewalls, and plant change control for PLC, RTU, IED, and fieldbus layers.
